## Resistive Switching Memory Model using NovaTCAD

# -Based on Monte Carlo Simulation of O2 diffusions

### Resistive switching physical processes

- Temperature activated O2 generation and recombination.
- Temperature activated hopping of O2 at interstitial sites.
- Poole-Frenkel de-trapping model for off state leakage current.
- Absorption and release of O2 by electrodes.
- Physical based probabilities with field and temperature dependence.
- > O2 site represented by a circuit node in Crosslight MiniSpice model.
- MiniSpice special resistor models: models based on sinh() function and quantum point contact.
- MiniSpice included in NovaTCAD as Mixmode device simulation.

#### Resistive switching Monte-Carlo approach

Vo generation rate, with Ea as activation energy, delta-phi as barrier lowered by field

$$P_a = f \exp(-\frac{E_a - \Delta \varphi_1}{k_B T_{loc}})$$

Interstitial O2 hopping rate with Eh as activation energy.

$$P_h = f \exp(-\frac{E_h - \Delta \varphi_2}{k_B T_{loc}})$$

#### Use of CSUPREM for TCAD mesh

#### Potential (V)

## Summary

- > Monte Carlo method integrated with NovaTCAD mixmode.
- Basic set and reset characteristics demonstrated.
- Suitable for TCAD design as well as for research.
